PROFILE

Full Stack Engineer with **4.5+ years** of experience in **backend systems, microservices**, and **real-time applications**, with strong **frontend expertise** in **React** and **Next.js**. Led engineering teams delivering **production-grade** platforms across **SaaS, real estate, solar**, and enterprise domains using **Node.js, AWS, and event-driven architecture**.

SKILLS

Core Technologies

Node.js, TypeScript, React, Next.js, GraphQL, REST APIs, Microservices, Event-Driven Architecture, Distributed Systems, System Design, Redis, WebSockets, WebRTC, MongoDB, PostgreSQL, Pinecone, API Design, Authentication (JWT, OAuth)

Cloud, DevOps & Integrations

AWS (EC2, S3, Lambda, EKS, ECS, CloudWatch), Serverless Architecture, Docker, CI/CD, NGINX, Firebase, Twilio, Payment Systems (Stripe, Razorpay, PayPal, Paddle), OAuth Integrations (Google, Microsoft, Apple), AI Integrations (OpenAI, LLM APIs), Git, GitLab, Bitbucket

EDUCATION

B.E. Computer Science Engineering, Chandigarh University

2019 – 2023

WORK EXPERIENCE

Sr. Full Stack Engineer, Eminence Technology

04/2024 – 07/2026

- Serve as **Full Stack Tech Lead** and core technical owner for high-impact, enterprise-grade products, driving initiatives from concept to production across the **MERN / Node.js + React** stack with full ownership and accountability.
- Translate ambiguous business requirements into clear, actionable technical roadmaps, ensuring predictable delivery and high client confidence in **Agile/Scrum** environments.
- Act as primary client-facing technical lead — owning requirement discovery, solution architecture walkthroughs, sprint planning, and stakeholder alignment across cross-functional engineering teams.
- Consistently ship mission-critical, production-grade systems on time by balancing speed, code quality, and long-term scalability across **microservices** and distributed architectures.
- Drive key **system design and architecture** decisions (API design, database schema, cloud infrastructure) that reduce technical risk and improve reliability.
- **Lead and mentor a team of full stack engineers** — setting coding standards, conducting code reviews, enforcing **CI/CD** and Git best practices, and unblocking execution to maximize delivery velocity.

Full Stack Engineer, FarmHeal

03/2022 – 04/2024

- Led end-to-end development of client-facing full stack platforms - including an enterprise inventory management system and a society management solution - using **React, Node.js, AWS Lambda, API Gateway, and S3** in a **serverless microservices architecture**.
- Designed, built, and integrated scalable **REST APIs** with SSR and full-stack performance optimizations, **reducing page load times by ~37%**.
- Collaborated with cross-functional product, design, and QA teams in **Agile/Scrum** sprints to deliver high-availability full stack solutions for enterprise clients.

Research Intern, Samsung R&D Institute

08/2021 – 03/2022

Developed a **deep learning-based recommendation system** using 10,000+ data samples for user classification (Samsung PenUp), applying data engineering and machine learning techniques to improve personalization accuracy.

PROJECTS

Solar Calculator, A virtual solar calculator for estimating energy production, costs, savings, and ROI prior to solar installation.

- Engineered an end-to-end solar cost-benefit analysis platform, from data ingestion to ROI insights.
- Ingested and processed a full year of 15-minute interval usage data (~35,000 points) via the Smart Meter Texas (SMT) API.
- Built proprietary algorithms to track sun position and model shading, enabling precise, panel-specific production estimates.
- Developed a tariff engine for location-based rate structures and accurate cost modeling.
- Built interactive charts visualizing battery and grid activity, and unified all data into a single cost-benefit engine for confident investment decisions.

TruGamer, Unified Gaming Platform, Next.js, Strapi, PostgreSQL, IGDB API, Steam, Xbox, PSN APIs, Node.js, AWS

- Engineered an IGDB game data ingestion pipeline processing 350,000+ games with batching, rate limiting, and retry logic sustained a 14-day non-stop run with zero data loss; built webhook pipeline for continuous game updates.
- Integrated Steam, Xbox, and PSN APIs with custom per-platform ID resolution, reducing sync to 4–6 API calls per platform per user; implemented priority queue scheduling and response caching for 700+ active users.

ICM, Intelligent Cost Manager (University of Melbourne), Node.js, PostgreSQL, Supabase, React, AWS, Auth0

- Built a production-grade cost benchmarking platform for the University of Melbourne, managing construction project costs across an 8-level data hierarchy with real-time validation at every level.
- Designed a 26-table normalized PostgreSQL schema with recursive parent-child cost verification and role-based access control (Owner/Admin/Editor/Viewer) using Auth0, JWT, and org-level data isolation.
